

Data Science for Economists

Example Presentation

Jiaxi Li

University of North Carolina | ECON 370

Introduction

In this section, you would **briefly** summarize the highlights of your project. Think that this is a project report to your boss. Convince that person why your model and strategy is worth to invest in and this slide is to catch your boss's eyes!

An example:

Highlight of the project:

- Data: 5 Macro predictors, 5 financial market indicators, 1 geopolitical indicator.
- Model: *Linear Model* as benchmark and *Neural Network Model* as the advanced model
- Achievement: With the more complex model, I am able to move the predictive R^2 from XX to XX. With a strategy of XXX, I was able to boost the overall return in the period XXX from XX to XX.

Data

Here is a table of data that I am using with brief reasoning:

Table: Possible Data Related to Stock Returns

Variable	Type	Reason
GDP	Macro	Reflects economic growth
Lag Return	Financial	Captures return persistence
...	...	

I would particularly point out XX variable. Although it is not standard, due to XXX, I believe that it has value to predict returns.

Model

Beyond linear model, I also used XX model for the analysis.

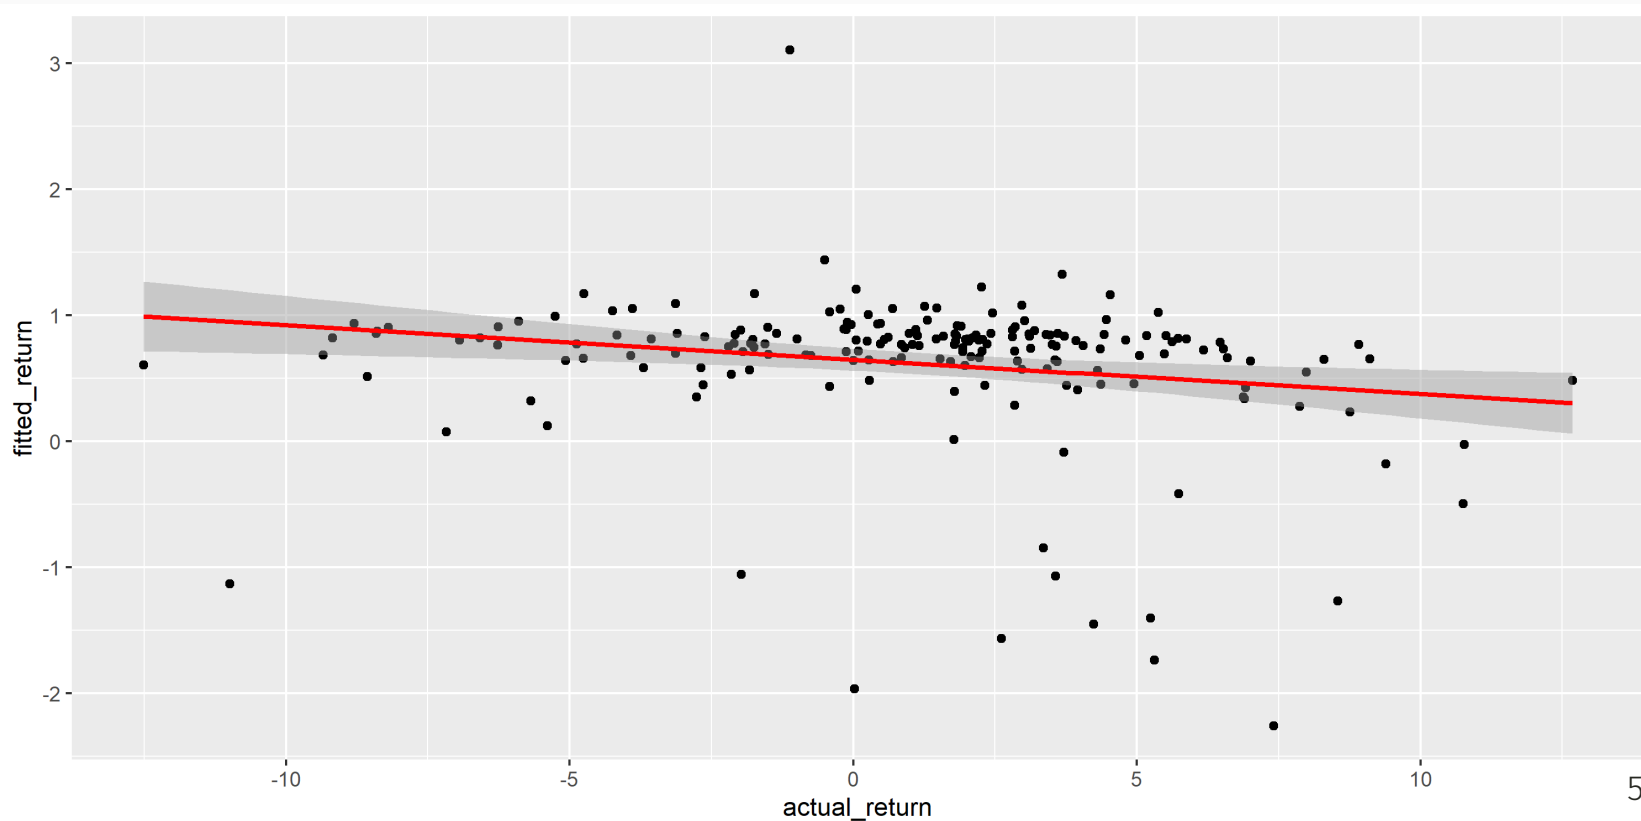

XX model is a XX model and it uses XX technique to get a better fit of the data.

There are some considerations of the XX model and it uses XX as tuning parameters.

Main Result

With an expanding window from XX to XX date, and XX model, here is the out of sample R^2 and the actual vs. fitted returns plot:

(Here, you can save the plot from your main script, upload it onto GitHub, and then load the data here. I will demonstrate using this method.)

Other Results (name your own title)

Here, you can compare different trading strategies, explore the strong point and weak point of your model etc... I will show the result of trading strategies here:

With the buy/hold when there is positive predicted return and sell/stay out otherwise, the performance of the XX model is better than the linear model:
